

## **EXPERIMENT – 2**

### **Program -4**

**Aim:** Subtract the contents of memory location 4001H from the memory location 2000H and place the result in memory location 4002H.

**Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; add your code here

MOV AX, 0200H ; base address is given to accumulator AX of 16 bits

MOV DS, AX ; data segment gets the base address of the AX

MOV DI, 0000H ; offset is 0 so the effective address (EA) is 2000H

MOV [DI], 9H ; 9h i.e. hexadecimal is move to destination index

MOV BX, [DI] ; and BX gets value of DX

; same as above instruction the later will be followed

MOV DI, 2001H

MOV [DI], 5H

MOV CX, [DI]

SUB BX, CX ; subtracts source from destination and answer is stored in destination

MOV DI, 2002H ; to store answer the offset is being assigned

MOV [DI], BX

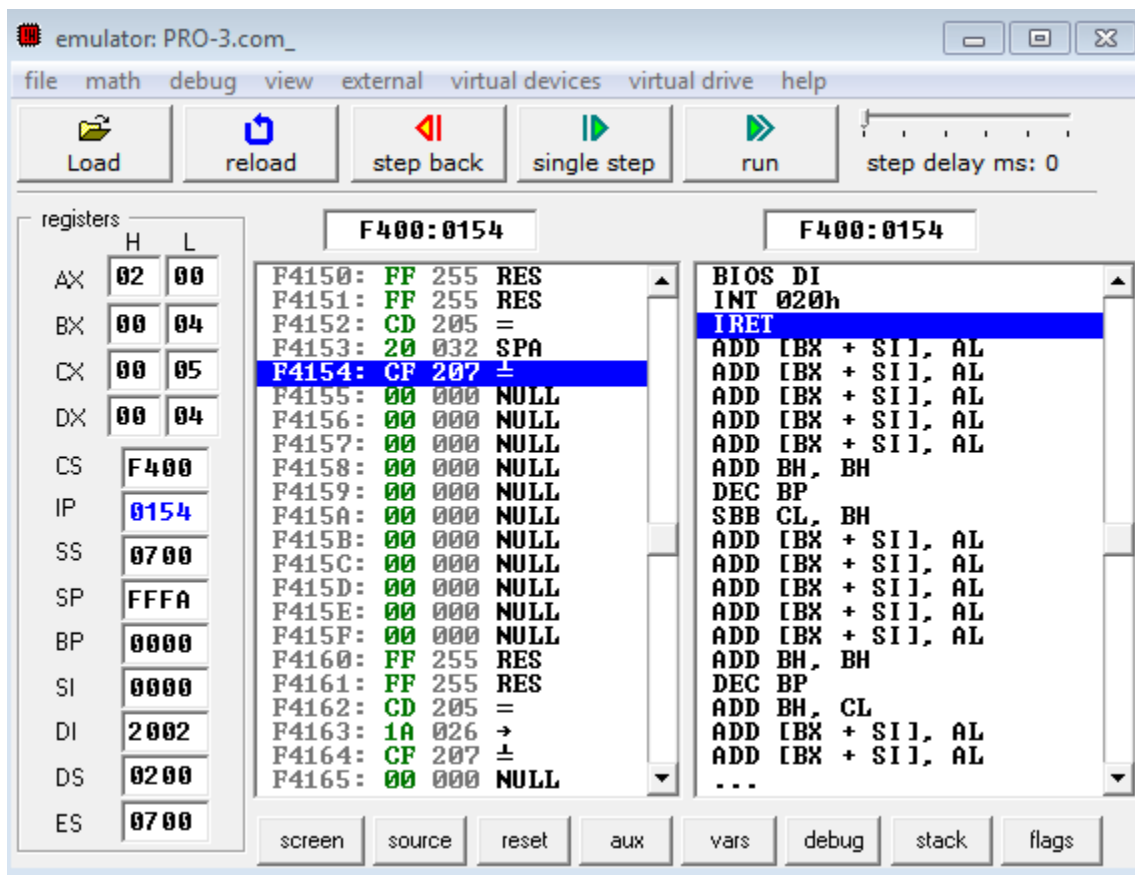

MOV DX, [DI] ; DX stores the result

ret

## Input / Output:

Input: BX: 9H, CX: 4H

Output: DX: 5H

## **EXPERIMENT – 2**

### **Program -5**

**Aim:** Add the 16-bit number in memory locations 4000H and 4001H to the 16-bit number in memory locations 4002H and 4003H. The most significant eight bits of the two numbers to be added are in memory locations 4001H and 4003H. Store the result in memory locations 4004H and 4005H with the most significant byte in memory location 4005H.

#### **Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; same as above code the AX is given base address and from offset assigned the value is being stored accordingly.

MOV AX, 0400H

MOV DS, AX

MOV DI, 0000H

MOV [DI], 2211H ; here MSB will be stored at 40001H and LSB at 4000H

MOV BX, [DI]

MOV DI, 0002H

MOV [DI], 4433H ; here MSB will be stored at 4003H and LSB at 4002H

MOV CX, [DI]

ADD BX, CX ; adds source and destination and result is stored in destination for 16bits

MOV DI, 0004H

MOV [DI], BX

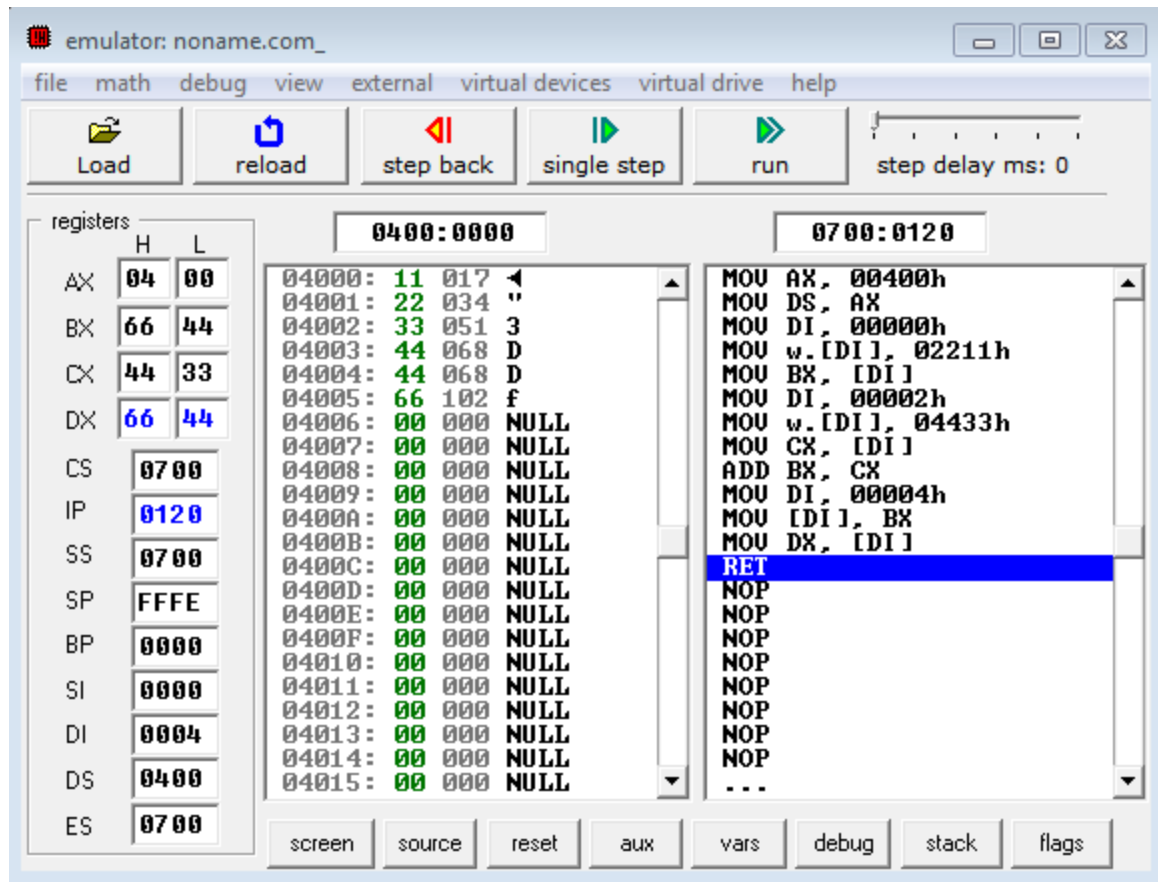

MOV DX, [DI] ; result is stored in DX and on address (LSB) 4004H and (MSB) 40005H, as it deals with 16bits

ret

### **Input / Output:**

Input: AX: 2211H, BX: 4433H

Output: 6644H

## EXPERIMENT – 2

### Program -6

**Aim:** Subtract the 16-bit number in memory locations 4002H and 4003H from the 16-bit number in memory locations 4000H and 4001H. The most significant eight bits of the two numbers are in memory locations 4001H and 4003H. Store the result in memory locations 4004H and 4005H with the most significant byte in Memory location 4005H.

#### **Code:**

; You may customize this and other start-up templates;

; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; same as above code the AX is given base address and from offset assigned the value is being stored accordingly.

; add your code here

MOV AX, 0400H

MOV DS, AX

MOV DI, 0000H

MOV [DI], 2211H

MOV BX, [DI]

MOV DI, 0002H

MOV [DI], 4433H

MOV CX, [DI]

SUB CX, BX ; BX is subtracted from CX (16bits) and the value is stored similar to the previous program, MSB at higher level address and LSB at lower.

MOV DI, 0004H

MOV [DI], CX

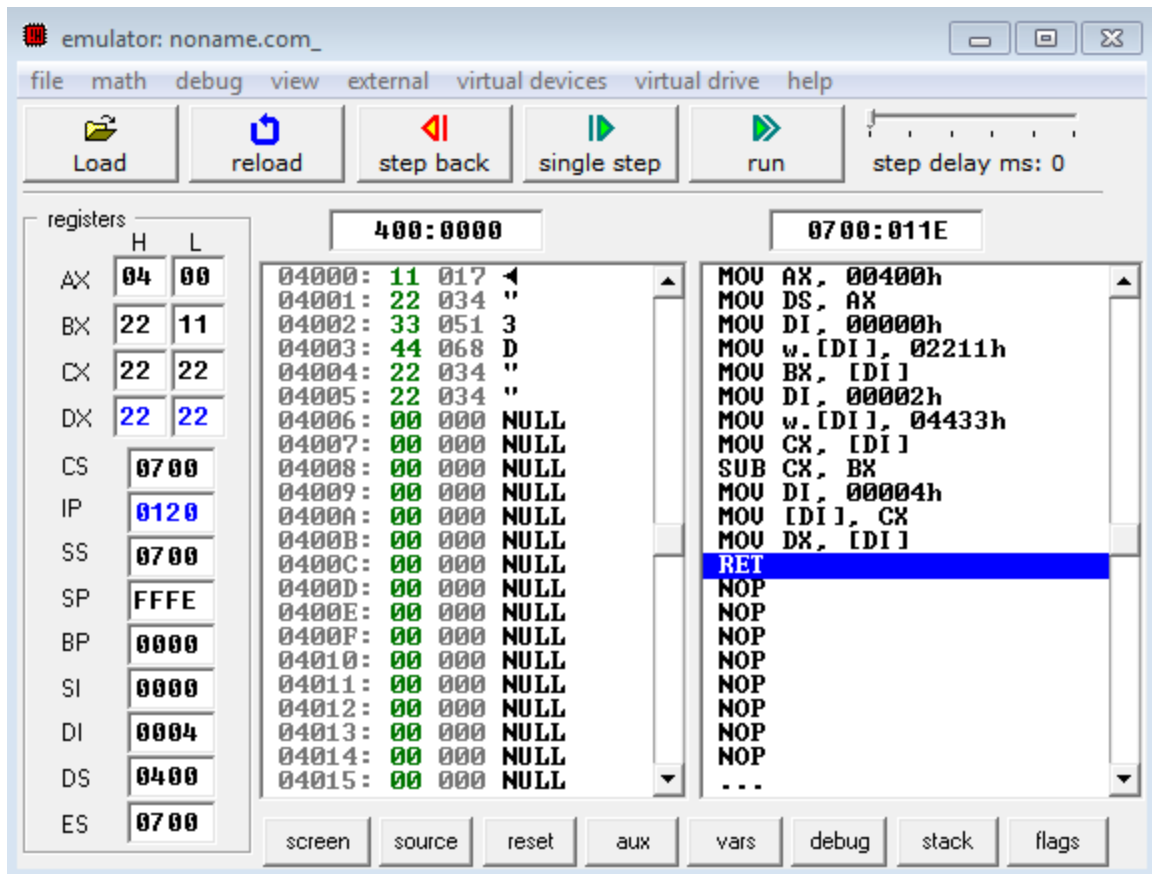

MOV DX, [DI]

Ret

**Input / Output:**

Input: AX: 2211H, BX: 4433H

Output: 2222H

## **EXPERIMENT – 2**

### **Program -7**

**Aim:** Add Two 32-bit numbers stored in consecutive memory locations and store the result in memory locations starting from 7000H

**Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; for 32 bits the operations between two numbers will occur between the 16bit LSB's of each number and then another operation will occur on 16bits MSB including carry flag.

MOV AX, 0400H

MOV DS, AX

MOV DI, 0000H

MOV [DI], 7744H ; LSB of first number is assigned to DI and later to BX

MOV BX, [DI] ; from 4000H and 40001H LSB of first number will be stored

MOV DI, 0004H

MOV [DI], 4433H ; LSB of second number is assigned to DI and later to CX

MOV CX, [DI] ; from 4004H and 4005H LSB of second number will be stored

ADD BX, CX

MOV DI, 2000H ; the result of first LSB addition will be stored at 6000H and 6001H

MOV [DI], BX

MOV DX, [DI] ; result of LSB stored in DX

MOV DI, 0002H

MOV [DI], 2211H ; the MSB of first number is stored from 4002H to 4003H

MOV BX, [DI]

MOV DI, 0006H

MOV [DI], 3322H ; the MSB of second number is stored from 4006H to 4007H

MOV CX, [DI]

ADC BX, CX ; add with carry operation is the summation of source destination and the carry flag generated by the LSB's addition

MOV DI, 2002H ; result is stored at 6002H and 6003H of MSB's addition with carry

MOV [DI], BX

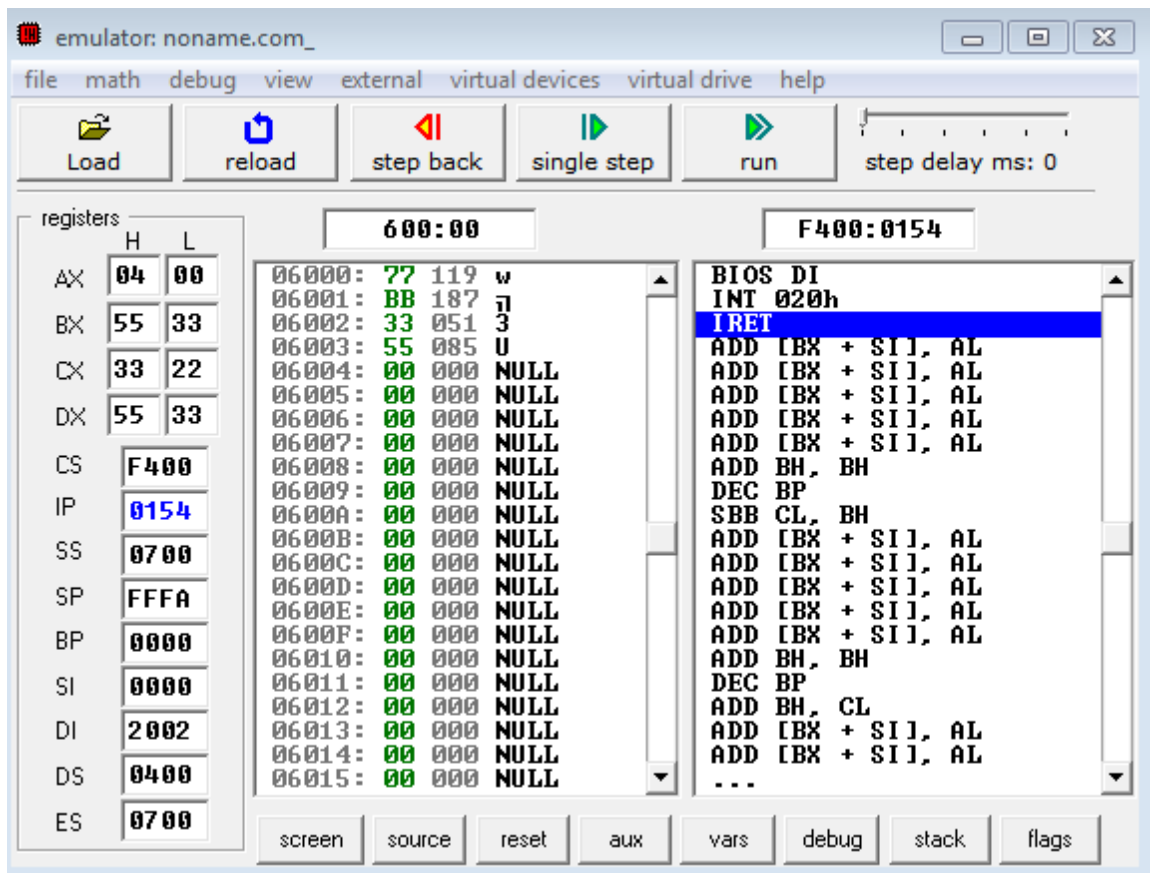

MOV DX, [DI]

ret

**Input/ Output:**

Input: BX: 22117744 and CX: 33224433

Output: 5533BB77

## **EXPERIMENT – 2**

### **Program -8**

**Aim:** Subtract Two 32-bit numbers stored in consecutive memory locations and store the result in memory locations starting from 7000H

**Code:**

; You may customize this and other start-up templates;

; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; here the subtraction of two LSB's take place and then for the MSB's.

MOV AX, 0400H

MOV DS, AX

MOV DI, 0000H

MOV [DI], 8899H ; LSB of first number is stored on 4000H and 4001H

MOV BX, [DI]

MOV DI, 0004H

MOV [DI], 9933H ; LSB of second number is stored on 4004H and 4005H

MOV CX, [DI]

SUB BX, CX

MOV DI, 2000H ; result of LSB is stored at 6000H and 6001H

MOV [DI], BX

MOV DX, [DI]

MOV DI, 0002H ; MSB of first number is stored from 4002H to 4003H

MOV [DI], 5566H

MOV BX, [DI]

MOV DI, 0006H ; MSB of second number is stored from 4006H to 4007H

MOV [DI], 1144H

MOV CX, [DI]

SBB BX, CX ; Subtract with borrow

MOV DI, 2002H ; result of MSB is stored in 6002H to 6003H

MOV [DI], BX

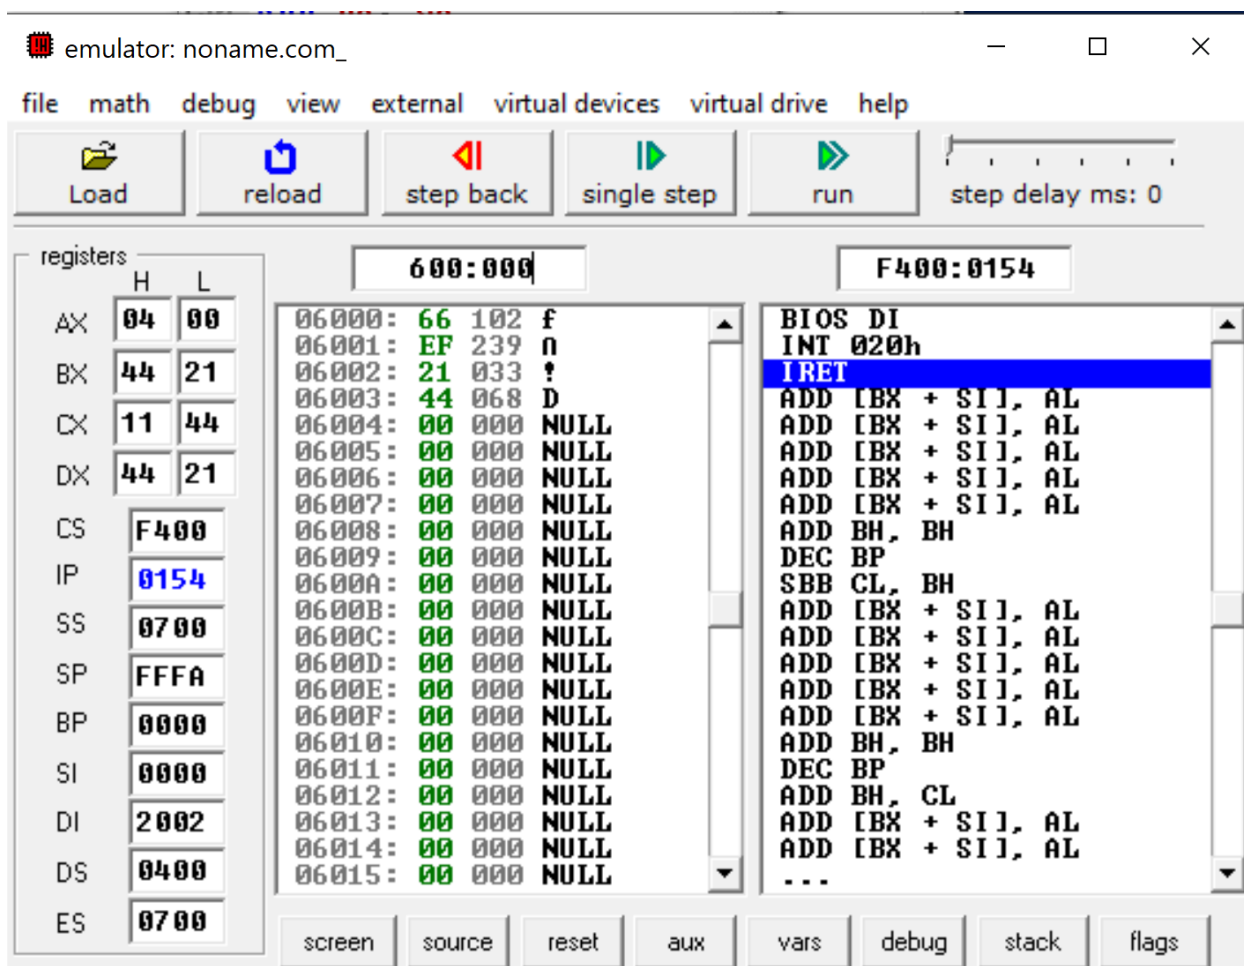

MOV DX, [DI]

ret

**Input/ Output:**

Input: BX: 55668899 and CX: 11449933

Output: 4421EF66

## **EXPERIMENT – 2**

### **Program -9**

**Aim:** Write an assembly language program to convert temperature in F to C.

$$C = (F - 32) * 5/9$$

**Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; C=(F-32) \*5/9

mov ax,0400h

mov ds,ax

mov di,000h

mov ax, 104H ; move 104 in AX

mov [di],ax

sub ax,32 ; subtract 104-32 and result will be saved in AX

```
mov bx,5
```

```
mul bx ; multiply AX and BX
```

```
mov bx,9
```

```
div bx ; multiply AX and BX
```

```
mov di,0002h
```

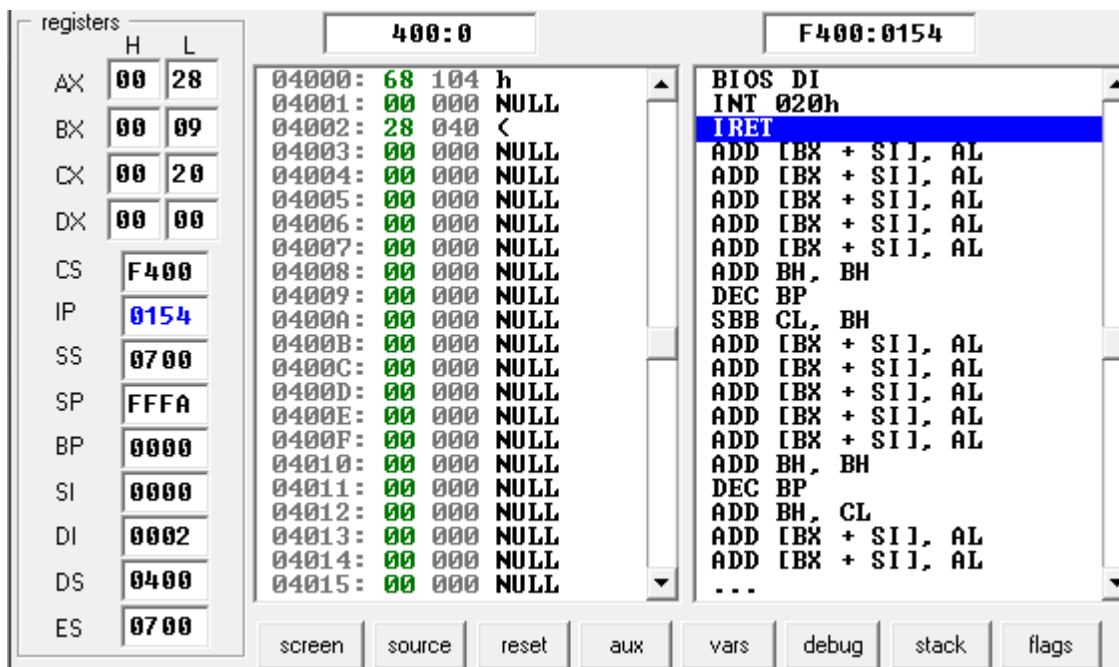

```
mov [di], ax
```

```
ret
```

## Input/ Output:

Input: AX: 104H

Output: AX: 28H

## **EXPERIMENT – 2**

### **Program -1**

**Aim:** Store the data byte 32H into memory location 4000H.

**Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

mov bx,0400h

mov ds,bx ; cannot move address to DS so made use of accumulator

mov di,0000h ; 10h\*base+offset

mov [di],32h

ret

**Input/ Output:**

Input: BX: 400h

Output: 4000: 32h

registers		400:0000		0710:0000	
	H L				
AX	00 00	04000:	32 050 2	MOV	b.[00400h], 0C8h
BX	04 00	04001:	00 000 NULL	MOV	BX, 00400h
CX	00 11	04002:	00 000 NULL	MOV	DS, BX
DX	00 00	04003:	00 000 NULL	MOV	DI, 00000h
CS	F400	04004:	00 000 NULL	MOV	b.[DI], 032h
IP	0154	04005:	00 000 NULL	RET	
SS	0700	04006:	00 000 NULL	NOP	
		04007:	00 000 NULL	NOP	
		04008:	00 000 NULL	NOP	
		04009:	00 000 NULL	NOP	
		0400A:	00 000 NULL	NOP	
		0400B:	00 000 NULL	NOP	
		0400C:	00 000 NULL	NOP	

## **EXPERIMENT – 2**

### **Program -2**

**Aim:** Exchange the contents of memory locations 2000H and 4000H

**Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

org 100h

; add your code here

mov ax,0200h ; base address 2000 stored in AX

mov ds,ax

mov di,0000h

mov [di] ; 19h; memory location [2000h] will have 19h

mov si,2000h ; 4000h location

mov [si] ; 26h 4000h memory location will have 26h

mov bx, [di] ; bx will have 19h

mov cx, [si] ; cx will have 26h

mov [di], cx ; now exchange will take place and cx will be move to DI

mov [si], bx; 19h in bx will be moved to SI

ret

## Input/ Output:

Input: BX: 19h, CX:26h

Output: CX:19h, BX:26h

The screenshot displays a debugger interface with two panels. The top panel shows the initial state of registers and memory, while the bottom panel shows the state after an instruction execution.

**Top Panel:**

- Registers:**
  - AX: 02 00
  - BX: 00 19
  - CX: 00 26
  - DX: 00 00
  - CS: F400
  - IP: 0154
  - SS: 0700
  - SP: FFFA
  - BP: 0000
  - SI: 2000
- Memory Dump (0400:000 to F400:00FE):**
  - 04000: 19 025 ↓
  - 04001: 00 000 NULL

ADD [BX + SI], AL
ADD [BX + SI], AL
ADD [BX + SI], AL
ADD [BX + SI], AL
ADD [BX + SI], AL
ADD [BX + SI], AL
...
```

At the bottom of the window are buttons for: screen, source, reset, aux, vars, debug, stack, and flags.

## **EXPERIMENT – 2**

### **Program -3**

**Aim:** Convert the below given C Program into Assembly Language.

```
main()
{ intl,m,n,o,p;
l=m+n-o+p; }
```

#### **Code:**

; You may customize this and other start-up templates;  
; The location of this template is c:\emu8086\inc\0\_com\_template.txt

```
org 100h
; add your code here
; here the four variables are taken in form of immediate data and the operation are performed
using arithmetic operation
```

```
org 100h
mov ax,0200h
mov ds,ax
mov [001h],10 ; memory location 2001h will have 10
```

```
mov [002h],11 ; memory location 2001h will have 11
```

```
mov [003h],14 ; memory location 2001h will have 14
```

```
mov [004h],115 ; memory location 2001h will have 115
```

add ax,[001h] ; value in AX and 10 will be added

add ax,[002h] ; value of AX will be added with 11

sub ax,[003h] ; value of AX is subtracted with 14

add ax,[004h] ; value of AX is added to 115

mov [005h],ax ; the final result is stored in 2005h memory location

ret

### Input/ Output:

Input: [2001h]:10, [2002h]:11, [2003h]:14, [2004h]:115

Output: [2005h]: 7A
